# AVENGER AG<sup>®</sup>

BURNDOWN HERBICIDE

## Arid Climate Tip Sheet

Avenger Ag Herbicide mode of action is dissolving the waxy cuticle of treated weeds. The spray solution needs time on the leaf surface to dissolve the cuticle. In arid climates weeds can develop a thicker cuticle, due to low soil moisture and low organic matter soils.

### Keys to Optimal Weed Control with Avenger Ag Herbicide

- ⇒ Concentration— Apply 14% concentration spray solution
- ⇒ Coverage—Ensure thorough surface area coverage

### Arid Climate Recommendations

- ⇒ Apply in the cooler parts of the day (morning) encourage slow drying time on leaf surface
- ⇒ Avoid applications during windy conditions
- ⇒ Avoid treating drought stressed weeds
- ⇒ Pre-irrigate a day to two prior to application – to keep humidity higher at soil surface & soften weed cuticle
- ⇒ Use an organic surfactant for increased coverage & reduced rapid evaporation.
- ⇒ Treat weeds when they are small, especially in reduced spray solution applications
